

Indonesian Civil Society Petition to the European Parliament on Biofuels Policy

Jakarta , Indonesia
September, 2013

On September 11 , 2013, the EU Parliament will vote on vital reforms to EU biofuels policy. If no action is taken to restrict demand for biofuels, this Directive will cause a huge negative impact for communities and environment in producer countries such as Indonesia which are growing biofuel crops for the European market.

Palm oil produced in Indonesia and Malaysia is playing an increasing role in supplying biodiesel to meet EU targets. At the same time, biofuels continue to be an important part of the Indonesian government's plan to develop palm oil, with predictions of increased palm oil plantations from 11 million hectares today to around 28 million hectares by 2020.

We, Indonesian civil society, call upon the European Parliament not to turn a blind eye to the devastating impacts of biofuel production in producer countries such as Indonesia. The target set by the biofuels policies will encourage massive and intensive expansion of large-scale industrial monoculture plantations, such as oil palm, which are continuing to cause environmental, social and economic problems for millions of Indonesians.

Large-scale industrial oil palm plantations have caused serious problems for the community and the environment in Indonesia, and other producer countries. Some key issues are :

- 1 . Large -scale oil palm plantations are one of the biggest contributors to Indonesia's greenhouse gas emissions due to deforestation, fires and the draining of carbon-rich peatlands. Therefore, biofuels that drive expansion of palm oil will not be able to reduce greenhouse gas emissions. On the contrary, they will increase greenhouse gas emissions, making climate change worse.
- 2 . The development of large-scale industrial oil palm plantations has also resulted in the grabbing of indigenous peoples' and local communities' lands, land conflicts, and human rights violations by state security forces. Non-recognition of the rights of indigenous peoples and local communities to their land has led to conflicts between communities and companies, which has often ended in violence perpetrated by the security forces in support of the company concerned.
3. The current system of large-scale industrial oil palm plantations does not respect the rights of workers, causes gender injustices, and often involves child labour in the production process, resulting in children losing their right to education. Eighty percent of workers in large-scale industrial oil palm plantations - men and women - are casual laborers who have no guarantee of safety at work or job security, and are paid wages which are too low to meet daily needs.

4 . The development of large-scale industrial oil palm plantations leads to loss of food sovereignty of indigenous peoples, local communities and people living in coastal areas and small islands who are heavily dependent on forests as their sources of food and livelihood. Many large-scale industrial oil palm companies destroy land and forests, including mangrove forests and fertile coastal areas and replace them with oil palm monoculture plantations.

We, Indonesian civil society, are very concerned about the EU's biofuel policy which will have huge negative impacts on millions of Indonesians and will contribute to rising and 'globally significant' greenhouse gas emissions in Indonesia that are causing climate change.

Therefore, we, Indonesian civil society, call on the EU to:

- 1 . Not use biofuel derived from large-scale monoculture plantations
- 2 . Not use biofuel that comes from clearing natural forests, peatlands, or mangrove forests
3. Not use biofuel derived from lands where companies are in conflict with indigenous peoples and local communities
4. Not use biofuel that comes from companies involved in human rights violations, including violations of workers' rights, women's rights, and where production process involve child labor
- 5 . Reduce the consumption of palm oil and other biodiesels that are driving global palm oil demand, and immediately cease the use of palm oil for biofuel.
